Dear Brian,

Thanks so much for introducing us to the PowerTwist Plus V-Belts for our Data-Aire CRAC units. We installed the first belt on a unit that was clearly in need of a belt change, so we were able to see an immediate increase in cooling output within hours, and that proved to us that maintaining belt tension and stability on the blower motors was a larger factor in cooling output and efficiency than we ever considered.

That being said, when you combine the fact that the PowerTwist Plus V-belts grip better and do not loosen over time like traditional belts, we are able to maximize cooling output while maintaining maximum motor efficiency at a non-depreciating rate now, and that translates into saving energy and increasing the life expectancy of the units.

My facilities guys also like the PowerTwist Plus V-belts because they last much longer than our other belts (so they don't have to install them nearly as often), and they are so much easier to replace. I would recommend PowerTwist Plus.
